Shoreline Mapping
Last Quarter

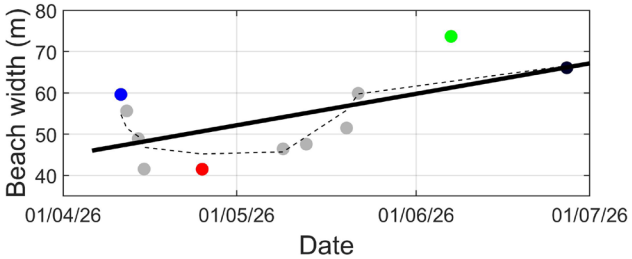

The figure below shows the shoreline and beach width changes at Henley Jetty from April 2026 to June 2026

Shorelines are mapped using photos taken near the mid-tide level. To calculate comparable beach widths, shorelines are adjusted to the mid-tide level using the beach slope.

Beach widths are calculated by the distance from the shoreline (corrected for tidal effects within the tidal tolerance) to fixed landward benchmarks along the beach. Reported beach widths refer to alongshore-averaged values over the shoreline mapping region.

Date:2026/06/27 Time:10:35 Tide:-0.44m AHD Contributor:CoastSnap_Anonymous

Beach width trend
+89.74 metres/year

CoastSnap
community beach monitoring

Note: the beach width trend shown in the figure refers to short-term trends over the reporting period only. This should not be used for long-term beach change analysis.
