
Treebnb Monitoring Report

City of Charles Sturt - 2023

Three Galah chicks in a large parrot box along Port Rd, West Croydon.

Report produced by James Smith, **fauNature**®
30 April 2024.

All photos contained within this report were taken from treebnb wildlife boxes or carved hollows, during the 2023 calendar year, unless otherwise stated.

SUMMARY

The City of Charles Sturt (CCS) engaged **fauNature®** to build, install and manage a range of wildlife boxes (WBs) between 2016-23 (Figure 1). In 2021, the first Carved Hollows (CHs; 7) were installed in a standing stag, in Wilford Res. Seaton, to complement the treebnb project. The Artificial Hollows (AHs equates to WBs & CHs) were acquired to enhance habitat for hollow dependent fauna and raise environmental awareness across the city.

For the first phase of the treebnb Project, 68 WBs were installed in 2016-17. An additional 22 WBs, were delivered as Phase II, Aug-Sept 2017. Modest addition were made between 2018-20, then 100 additional WBs were added along Port Rd in spring 2021. The first Carved Hollows (CHs) were installed in Wilford Res., in November of the same year. Numerous WBs have been redeployment, including nine of ten painted by local children for the Ovingham Level Crossing Removal Project, and installed adjacent to the overpass (Figure 2). In early 2023 the treebnb AH numbers stood at 210, in the middle of the year it was decided to scale this total back and maintain 200 assets.

Figure 1: James Smith installing a medium parrot box at ASSoE June, 2017.

Figure 2: Medium parrot box installed at Exeter Tce, Renown Park.

Location is a key factor in AH utilisation, as is the type of hollow installed. Additionally, the longer an AH is *in-situ*, the more likely it is to be occupied. The seven locations recorded 100% usage of available AHs, over the last 12 months. An additional six sites recorded usage in excess of 80%, including many of the Port Rd installations (Locations: Table 2-page 10).

The utilisation of WBs increased in spring 2023, in both numerical (119) and percentage terms (61%), over previous years, to the highest levels recorded (Table 1-Page 3). The difference between the number of boxes surveyed/serviced in 2021-22 was primarily due to non-accessibility (Exeter Tce closed or WBs with council) and boxes removed because of feral

Table 1: Comparison of 2021-2023 data

Reporting Year	2021		2022		2023	
	Number	%	Number	%	Number	%
No. of Usable Wildlife Boxes*	189		185		194	
“In Use”	89	47%	107	58%	119	61%
“Used in Last 12 Months”	64	34%	49	26%	47	24%
Empty/Unused	36	19%	29	16%	28	14%
Out of Service/Not Surveyed	13	13%	25	12%	6	3%

* “Usable” numbers of WBs, which excludes those out of service or not surveyed due to restricted access (e.g. WBs containing bee hive, absent, unusable, etc.)

bees or those damaged by wildlife.

Rainbow Lorikeets were the species observed most within WBs, across the CCS. Ninety-two WBs were *In Use* by Rainbow Lorikeets (Figure 3) during the spring survey, while an additional 30 WBs had been *Used in Last 12 Months*.

Figure 3: Rainbow Lorikeet chicks, in a medium parrot box, at Sam Johnson Res.

Galahs were the second most common species recorded, with evidence of usage in 25 WBs, while Rosellas were recorded in five WBs. Other species recorded using the WBs included Wood Ducks, five Brushtail Possums, a Gould’s Wattle Bat (dead), an unidentified bat, Marble Geckoes and various spiders.

Larger parrot species, such as Galahs, are renowned for damaging WBs. The reasons behind why they damage the boxes is not fully understood, but activities involve increasing the entrance hole and chewing internally and/or externally to help maintain the parrots continuously growing beak.

Quite a few WBs were damaged by wildlife in 2023, with several being damaged badly enough, that they require replacement.

By contrast with 2017, 2018 and 2019, up take by feral honey bees over the spring survey period was low across the city, with only two WBs being affected.

PROJECT BACKGROUND

CCS engaged *fauNature*® to manufacture and install WBs across the city (e.g. Figure 4), this initiative has subsequently become known as the ‘treebnb’ Project. The WBs were acquired to enhance habitat for hollow dependent fauna, deliver environmental off-set and raise environmental awareness.

Sites for installation were assessed in conjunction with CCS staff. Recommendations for preferred locations were provided, with consideration given to the needs of native fauna, arboreal resources available, educational opportunities and spread throughout the city.

Timeline - Wildlife Box installations were undertaken at different times/phases, as follows:

- August 2016-June 2017 - 52 WBs treebnb Phase I;
- August 2016 - 10 Brushtail Boxes Torrens Rd to River Torrens (T2T);
- June 2017 - 6 WBS Adelaide Secondary School of English;
- Aug-September 2017 - 22 WBs treebnb Phase II;
- June 2018 - 5 WBs Smart Cities Phase III boxes;
- March & December 2020 - 5 WBs Parfitt Square & 6 Trust Res. treebnb Phase IV (four of which were redeployed);
- Feb-Mar 2021 - 100 WBs treebnb Phase V Port Rd.
- Nov 2021 - 7 Carved Hollows, Wilford Reserve.
- Jun 2022 - 10 WBs Ovingham-Torrens Rd upgrade (nine of which were redeployed).
- Aug-Sept 2023 - 7 WBs redeployed from Port Rd to Royal Park.

Figure 5: Possum box installed in Phase I, off Weemala St, Flinders Park.

Figure 4: A bat box on at Port Rd, Cheltenham.

Phase I of the treebnb Project was augmented by an additional 10 BPBs (e.g. Figure 5) delivered as part of the Torrens Road to Torrens River (T2T) Project and six WBs as part of the Adelaide Secondary School of English (ASSoE) Project. The majority of the installations took place August 2016, at eight (8) locations across the city including Linear Park (3), Sam Johnson Res., McInerney Res., St Clair,

Charlotte St and Henley Community Garden. The remaining WB installations for Phase I of the treebnb project took place in June 2017 at the ASSoE, an additional Linear Park site, as well as Exeter Tce. (Locations: Table 2-page 10).

A second Phase, installing 22 WBs took place August-September, 2017. Seven of the WBs were installed in one new park (Albert Greenshields Res.), with the remainder distributed across three of the existing locations.

Phase III included a further five specially designed wildlife boxes, which integrate environmental and wildlife sensors, together with a digital camera. These boxes were installed in Sam Johnson Reserve in June, 2018.

Phase IV took place in two stages, an autumn 2020 install in Parfitt Square, then a December install at Trust Res., Semaphore Park. An additional five boxes were installed in Parfitt Sq, which included a possum box built by Aiden Shea. Two new WBs were also installed in Trust Res. Semaphore Park in mid-December, together with four redeployed WBs. The nine Exeter Tce boxes were removed during spring 2020, due to reclamation of the land, by Department for Planning, Transport and Infrastructure (DPTI). These WBs were redeployed to installation sites across the city, including Semaphore Park Trust Res. (4).

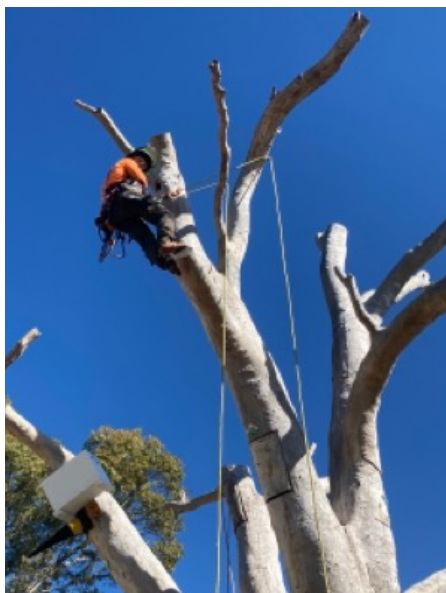

Figure 6: Small parrot carved hollow (# 203) being inspected, in Wilford Res. Seaton.

Phase V of the treebnb project, was delivered in early 2021. One hundred WBs, were funded as part of an environmental off-set program for the Port Rd drainage project. The artificial hollows (AH) were primarily for parrots, however kookaburra, pardalote and bat boxes were also installed. Installation took place in Feb-Mar 2021.

Seven Carved Hollows (CHs: cavities carved into dead standing stags, to mimic naturally occurring hollows), were created in a large struggling red gum, in Wilford Res. Seaton (Figure 6). The intention was to retain as much of the tree as possible, while being a deviation from the traditional AH provision method, they are an excellent addition to the treebnb programme.

The Ovingham-Torrens Rd upgrade project engaged students from Brompton Primary School to construct and paint ten WB kits (nine redeployments and one new). These were installed in a park adjacent to the project in June 2022.

CCS determined following the 2022 annual report and autumn 2023 maintenance program that a ceiling of 200 WBs was to be established. Over the following four

months these reductions were achieved through damaged or bee hive infested WBs being retired (7), together with three carved bat hollows being removed from the survey schedule. Seven WBs were also removed from the Port and Woodville Rd intersection in August-September 2022, as one particularly destructive pair of Galahs had caused extensive damage to a number of local trees. These WBs were reinstalled at Royal Park following interest by local residents. The current treebnb box count has been maintained at the 200 level.

LOCATION & IDENTIFICATION

Two hundred AHs are managed across the CCS and it is essential to keep track of these assets. For each AH the following information has been recorded: location (park/road and suburb), tree type, hollow type, orientation, GPS coordinates and a unique identifying number affixed to the base/side. The identification number for the AHs include a three-digit sequential codes, complete with the project's name "treebnb", attached to each WB (Figure 7) or CH. Additionally, a Google Maps page/document is available showing the location and current status of the WBs (Appendix A).

Figure 7: 'treebnb' logo, with progressive box numbering (2016).

Figure 8: ASSoE small parrot box, with treebnb logo (#067).

Eleven sites were selected for installations during Phase I, including the following suburbs: Renown Park, Croydon Park, West Croydon, St Clair, Grange, Henley Beach, Kidman Park, Flinders Park and West Hindmarsh. The Phase II WBs were installed at one new and three existing sites (detailed above). Phase III WBs (Smart Cities Project) were added to one existing site. Additional sites, at Parfitt Square and Semaphore Park Trust Res. were added in 2020 as part of Phase IV. The Port Road WBs (Phase V) were added in 2021 and the redeployment at Exeter Tce, took place in 2022. Seven CHs all associated with a large red gum in Wilford Res. Seaton, were created in 2021.

A reduction in numbers (10) and the re-homing of seven WBs, were the major changes seen in 2023.

The WBs are typically coated with acrylic paints, for enhanced protection (Figure 4 & 5) or were artistically painted by the students of ASSoE and Brompton Primary School (Figure 2 & 8).

GPS locations are recorded for each AH (e.g. -34.87153S|138.53512E) to ensure council staff or contractors can locate the boxes, as necessary. This also enables the AHs to be added to the CCS asset register (Appendix B).

MONITORING & MAINTENANCE

The maintenance and monitoring processes involve the AHs being inspected initially from the ground, then at the height of the AH externally and finally internally. The AHs are assessed for evidence of use by wildlife, as well as overall condition (Figure 9). Details of the findings are recorded.

Maintenance of the WBs is recommended once per year, to ensure each WB offers:

- 1) A safe resource for people and wildlife;
- 2) Minimise potential impact on the tree;
- 3) To maximise the useful life of the box.

February-May is an ideal period to service the WBs, as by this time most birds will have completed their nesting, and annual usage will be at its lowest. Maintenance activities were undertaken in April-June 2023.

Species like Brushtail Possums or microbats may be present year-round, in such circumstances servicing the WBs is still undertaken, though not always fully. When there is fauna occupying a WB, additional precautions are taken (e.g. sealing entrance, securing wildlife).

During maintenance work, in addition to recording wildlife activity, the WBs are cleaned out removing old nesting material and remnants of previous breeding events (e.g. feathers, egg shells, faeces) as required, and new nesting material is added. The securing mechanisms for the WBs are also adjusted, to allow for tree growth and maximise safety.

Monitoring surveys for the WBs takes place during spring (September-November), so assessment is made during the period of highest nesting activity. The 2023 WB survey took place in late September to mid November.

Monitoring of CHs was undertaken twice in the first year, to ensure the safety and integrity of the tree. The consulting arborist advised after the spring 2022 inspection, visits could be scaled back to once annually. It is recommended this takes place to coincide with the peak breeding season in spring.

Figure 9: Medium parrot box on Port Rd, West Croydon. Damaged by Galahs.

Figure 10: Small parrot box, Port Rd, Woodville, base compromised by Galahs.

Photographs are taken during both monitoring and maintenance procedures. These highlight the various signs of wildlife activity (e.g. adults, joeys, chicks, eggs, fur, feathers, chewing, etc) and where relevant the condition of the AHs (Figure 9 & 10). Occasionally, Galahs may remove the securing pin on the door, so if the door opens, the WB becomes unusable for that period of time.

Feral Honey Bees are known to inhabit AHs of a suitable volume. CCS will be advised of any potential issues with the treebnd AHs, including bees, so appropriate action can be initiated. The removal/management of AHs containing bee hives is undertaken by qualified beekeepers. WBs inhabited by bees are unsuitable for re-use (without extensive refurbishment), due to an increased likelihood of bees re-occupying these assets. Once the bees have been removed, these WBs are destroyed and replacements are installed (except for school painted WBs).

ARTIFICIAL HOLLOW USAGE

Two hundred (200) AHs were in service in 2023, with seven WB having been retired and three CHs removed from the servicing schedule. This includes four CHs and 196 WBs. Collectively these AHs are distributed in 19 locations - across the city (Table 2-page 10), with WBs at a few of the smaller locations having been combined.

A breakdown of the types of WBs, installed across CCS during 2023 included:

- 27 Brushtail Possum Boxes (BPB)
- 67 Medium Parrot Boxes (MPB)
- 40 Small Parrot Boxes (SPB)
- 20 Large Parrot Boxes
- 25 Bat Boxes (BtB)
- 6 Duck Boxes (DkB)
- 5 Pardalote Boxes (PdB)
- 6 Kookaburra Boxes (KbK)
- 4 Carved Hollows: parrot.

Figure 11: Small parrot box (#013), with two Rainbow Lorikeet eggs, at Sam Johnson Res., Renown Park.

Fauna Recorded During Survey

Survey numbers were similar across autumn and spring due to replacement installations and WB availability. A total of 200 WBs, were surveyed during spring.

One hundred and nineteen WBs (61%), were *In Use* during the spring breeding season (Figure 11), if the unusable/non-assessable boxes are excluded (6 WBs). This is the highest occupancy, both in numerical and percentage terms historically recorded. In total, 123 (62%) of WBs were *In Use* at least once, when considered across the whole year.

By contrast only 40 (22%) of the WBs were *In Use* during autumn (non-breeding season), significantly higher than the numbers recorded in previous years. Additionally, 43 WBs (22%: spring survey) and 97 WBs (52%; autumn survey) had been *Used in Last Twelve Months*, demonstrated through evidence of breeding events (Figure 12), denning behaviours or wildlife activity ranging from chewing and scratching, disturbed bedding material, dead specimens, abandoned eggs, faecal matter, insect castings, fur and/or feathers.

Two WBs (1%) were occupied by feral honey bees during the spring survey. Twenty-eight (14%) WBs were Empty/Unused across the entire year. These mainly consisted of bat, pardalote and kookaburra boxes. Unusable/non-assessable WBs included bee hives (2; current) and those boxes which were extensively damaged (4).

Figure 12: Large parrot box (#160), with Galah laid eucalypt leaves as bedding, Port Rd, Woodville.

Vertebrate wildlife were recorded using AHs at most locations, although rates of usage differed. The bird species observed using the WBs over the spring 2023 period (Table 3-Page 12), included: Rainbow Lorikeets, Galahs, Eastern Rosellas and Wood Ducks, together with unidentified rosellas. Five Brushtail Possums were also recorded across the city.

Usage by Wildlife Box Location

High occupancy was observed across the city. AHs were *In Use* at every location, with usage in the previous six months ranging from 25-100%.

Usage of 100% of available AHs was recorded at seven sites and over 80% at an additional six sites. High usage was recorded at all Port Rd locations, Sam

Res., Kooralla Gr, Mountbatten Tce, Parfitt Square, Exeter Tce, Weemala St and Albert Greenshields.

Figure 14 : Dead Gould's Wattle Bat in a medium parrot box (#076), in McInerney Res., West Croydon.

Rainbow Lorikeets were well spread across, as were Galah breeding events. Port Rd WBs were extensively occupied by the various parrot species, as is expected. Wood Duck activity was recorded off Mountbatten Tce. Five Brushtail Possums (Figure 13) were observed across Sam Johnson Res. and Weemala St, including a mother and joey. A dead Gould's Wattle Bat (Figure 14) was recovered from a medium parrot box in McInerney Res. Bat droppings were also recorded in a bat box at Sam Johnson. Marbled geckoes and huntsman were recorded widely

Table 3: Spring 2022 survey bird usage, including egg and chick

Species Usage	In Use	Egg Count	Chick Count	Used in Last 12 Months
Rainbow Lorikeet	92	52	103	30
Galah	19	5	29	6
Eastern Rosella	1	3	0	1
Unidentified Rosellas	2	1	8	1
Wood Duck	1	5	-	-

across the city.

Fourteen of the 19 locations had over 50% of the WBs *In Use*, when assessed during the spring survey.

Wildlife box Usage by Fauna Type

The majority of possum, small parrot, medium parrot, large parrot and duck boxes, together with medium parrot and small parrot CHs, were used by the various parrot species during 2023. The WBs for the more difficult to attract species, including bats, kookaburras and pardalotes exhibited no use by the target vertebrate species, during the spring survey.

Rainbow Lorikeets were the most common species recorded during the survey period. Active nests were observed in 92 AHs, during the spring survey, while *Use in Last 6 Months* was noted in an additional 30 WBs, in spring.

Figure 15: Medium parrot box, with three Galah chicks, Charlotte Tce, Grange.

Galahs were the second most common breeding species recorded. Active nests were observed in 19 WBs during the spring survey (Figure 15), while *Used in Last 6 Months* was noted in an additional six WBs, in spring. This species can cause extensive damage to WBs they are investigating, occasionally rendering them unusable (Figure 9 & 10).

One nesting event was recorded in a WB, for Eastern Rosellas (Figure 16). A further two WB were *In Use* by unidentified rosellas. One additional WB had been *Used in the Last 6 Months*, by unidentified rosellas. Rosella figures appear lower than the average observed historically, this may well be due to a milder winter and early breeding onset by other species.

Wood Duck activity was observed in a single WB, located in Mountbatten Tce. The *In Use* WB (Figure 17), contained five Wood Duck eggs.

Five Brushtail Possums were observed during the spring survey period (Figure 13), three in Sam Johnson and two in Weemala St. There were two adults and a joey recorded at Sam Johnson and for the first time two possums were sighted at Weemala. Five possums is also the highest count observed in a single season.

A dead Gould's Wattle Bat was removed from a medium parrot box, in McInerney Res. (Figure 14). This is the first time a bat specimen has been

Figure 17: Brushtail box, with five Wood Duck eggs, at Mountbatten Tce.

observed, alive or dead within the city. Historically bat droppings have been the only indication of this group utilising any wildlife boxes. Bat droppings were also recorded in a WB (#022) during the survey period. Unfortunately, identification from a visual inspections of such droppings, is not possible.

Thirteen marbled geckos (Figure 18), five Huntsmen spiders and four other spiders were all recorded, principally in either Bat (BtB) or Pardalote Boxes (PdB). Feral bees are typically found in between 2-5% of WBs. Only two AHs, had been invaded by bees (1%), during the spring survey in 2023 (Figure 19).

Twenty-eight AHs were empty and potentially unused when surveyed, across both 2023 survey periods. Of these, most were either bat or pardalote boxes, with the remaining including a single large parrot hollow and two kookaburra boxes. WBs targeting less common or specialised species, have traditionally had significantly lower occupation rates.

Figure 16: Possum box, with three Eastern Rosella eggs, Albert Greenshields Res.

Figure 18: Bat box, with a Marbled Gecko, at Henley Community Garden.

Figure 19: Medium parrot box, with a bee hive, at Exeter Tce.

recorded at various locations across the city, though not using WBs. Rainbow Lorikeets were the most widespread species, recorded at the majority of sites during the spring WB surveys, closely followed by Noisy Miners. The other observed species included Australian Magpies, Magpie-Larks, Galahs, Feral Pigeons, Crested Pigeons, Red Wattlebirds, White-plumed Honeyeater, Musk Lorikeets, Eurasian Coots, Dusky Moorhen, Purple Swamphen, Little Pied Cormorants, Wood Ducks, Grey Teal, Pacific Black Ducks, Little Raven and Welcome Swallows.

The life expectancy of a WB is 8-12 years. This usually holds for small-medium size parrots, pardalotes, kookaburras, ringtail and brushtail possums. This life span however, will be shortened if the WB is inhabited by feral bees or large parrots take a destructive interest in it.

Wildlife species, particularly large parrots can cause significant damage to WBs. Parrots which may be responsible for the worst damage include Galahs, Sulphur-crested Cockatoos and Little Corellas, although to-date only Galahs have taken up residence in WBs. The damage may be considerable, however it is only when either the roof or door have been compromised or damage is so extensive the WB no longer offers a safe haven (Figure 20), is replacement necessary (Figure 9). Of the 194 boxes surveyed in Spring, the majority are in good condition (65%), 65 are in fair condition (32%) and six require replacement (3%).

Of the replacements, two are due to bee hives, together with four Galah/large parrot damaged boxes. A number of WBs, need a replacement floor, however the boxes themselves remain serviceable. Five boxes need to be moved/lowered for either safety/environmental reasons or repaired and reinstalled after limb failure.

Figure 20: Small parrot box, with Galah damage, in McInerney Res. required replacement.

CONCLUSIONS & RECOMMENDATIONS

The approach the CCS has taken with the treebnb Project, positively impacts an increasing number hollow dependent fauna, with 123 WBs *In Use* across the year (Figure 21). The 2023 year saw the highest percentage of boxes used by wildlife (61%), up on the previous record seen in 2022. An additional 17% of all WBs surveyed during spring, had been *Used in the Last 6 Months*. The available WBs supply much-needed habitat for various wildlife species, across the city.

Ideally the WBs will continue to be serviced (& monitored) between February and May annually (when usage is at its lowest), with a second monitoring taking place during the September-November breeding peak, each year. Annual servicing maximises the safety and functionality of the WBs, minimises the impact to host trees and enables WBs damage or occupation by feral bees to be identified, so appropriate steps can be taken to maintain these resources.

Following the spring WB survey, six wildlife boxes were no longer fit for purpose or had been removed. Two of these are/were due to infestation by bees. Bees limit the availability of hollows, and threaten the welfare of eggs and chicks, given

Figure 21: Large parrot box, with two Galah chicks, on Port Rd, West Croydon.

Australian wildlife has yet to evolve, to deal with this relatively recent threat. One of the CHs, previously occupied by bees has had the hive removed, rendering it fit for purpose again. It will continued to be monitored for potential re-occupation. Additionally, four WBs have been damaged by Galahs or other large parrots and have either been removed or require removal and replacement. Two boxes damaged by a fallen branch will be repaired and re-installed. All other boxes appear to be in serviceable condition.

The treebnb project currently capped at 200 WBs. Ten AHs were removed either from service (seven WBs) or monitoring (three CH) during 2023, to achieve this target.

Seven Carved Hollows to mimic natural hollows, were installed in a large struggling red gum in Wilford Res. Seaton in 2021 (inspection Figure 22). The hollows and

associated structure appear sound, so the arborist has suggested assessments be scaled back to one visit per year. The four parrot hollows will continue to be managed going forward.

It is recommended reporting continues to be undertaken annually.

Charles Sturt Council have decent hollow habitat coverage (Appendix A), through the provision of AHs in 19 locations across the city. There remains, scope to expand the number of hollows, in parks/reserves where WBs are already installed or within additional green-spaces, across the city, if council choses to pursue such opportunities.
